

### Abstract

There are at least two views on what relativism is. One is a view that relativism is a position that claims any positions are equally wrong or equally false as well as equally right or equally true. Another is a view that relativism is not the position that claims any positions are equally wrong or equally false but a position that claims any positions are equally right or equally true. This paper critically examines the two views and concludes the latter is a more proper concept of relativism according to critical rationalism, and the position that claims *any positions are equally wrong or equally false* is not relativism but relativizationism, which is compatible with criticism in Popper's sense.
